10^1
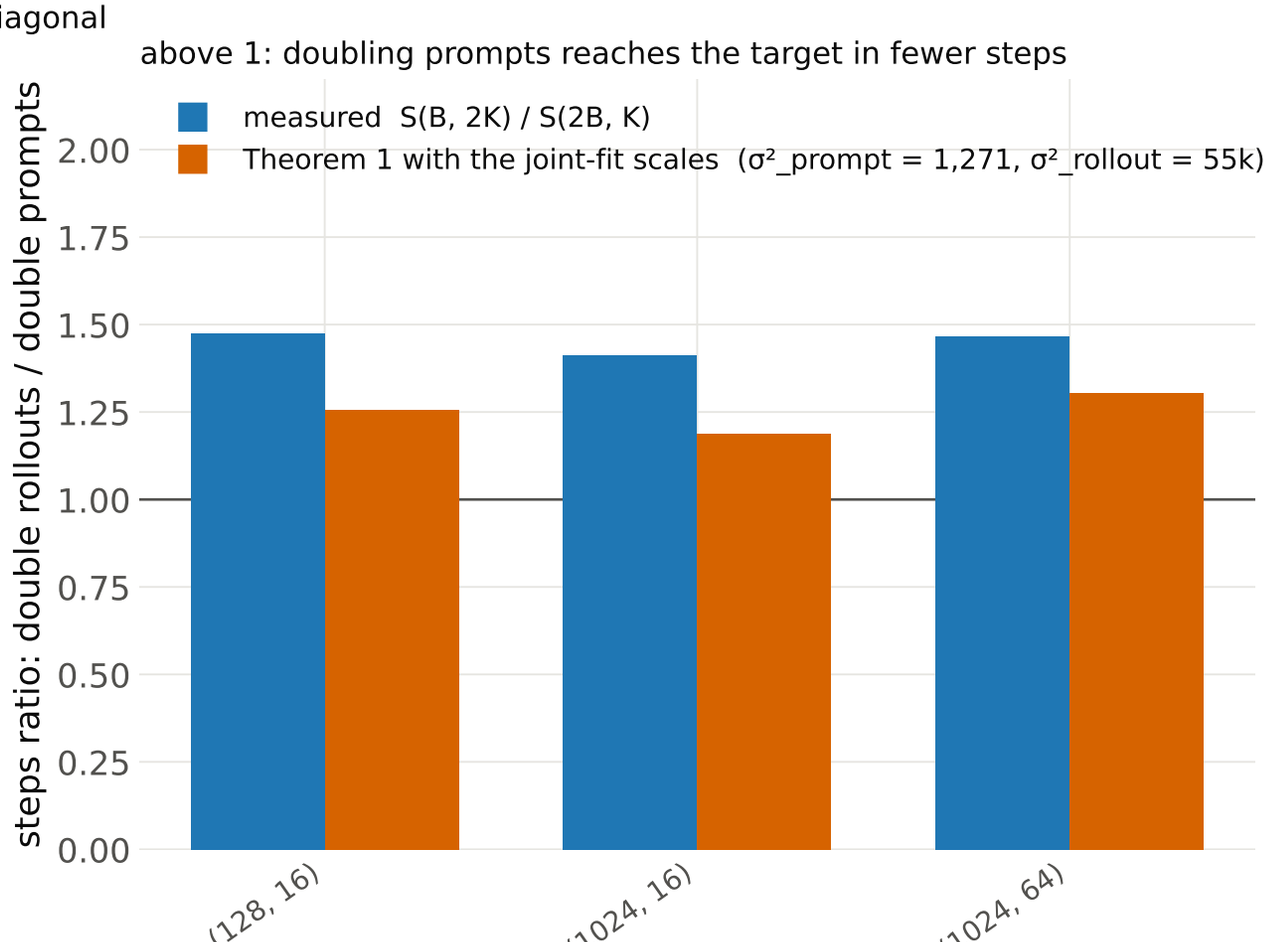
10^2
steps to 50% after doubling rollouts, S(B, 2K)
steps to 50% after doubling prompts, S(2B, K)



above 1: doubling prompts reaches the target in fewer steps
measured S(B, 2K) / S(2B, K)
Theorem 1 with the joint-fit scales (σ²_prompt = 1,271, σ²_rollout = 55k)
steps ratio: double rollouts / double prompts
